and the second second

#### Western North America temperature

IPCC AR6 Atlas (CMIP6 models)

**A**12

## Why are we doing this?

Western North America **temperature** and **precipitation** 

Models have **less agreement** about future local precipitation trends compared to temperature. This matters!

# ML Goal: Improve coarse-model simulations

#### High fidelity reference

reanalysis or fine-grid (~3km) simulation

Use machine learning to make coarse model behave more like reference

#### Climate model (25-200 km)

#### **Corrective approach**

- 1. Nudge coarse-resolution model towards reference dataset
- 2. Train ML to predict nudging tendencies with input coarse-resolution state
- 3. Run coarse-resolution model, with ML corrective tendency at each step

## Limitations of corrective approach

- ML corrective tendencies inaccurate & unstable outside training dataset
- Simulation is an online process and can produce out-of-sample data

ML-corrected simulations behave erratically & perform poorly (especially when winds included)

time Training dataset support

• Novelty detection is a branch of self-supervised learning that prédicts whether a sample belongs to a distribution given draws from distribution

• Novelty detection is a branch of self-supervised learning that predicts whether a sample belongs to a distribution given draws from distribution

Training sample

• Novelty detection is a branch of self-supervised learning that prédicts whether a sample belongs to a distribution given draws from distribution

Training sample New sample: Novelty New sample: In-distribution

• Novelty detection is a branch of self-supervised learning that prédicts whether a sample belongs to a distribution given draws from distribution

Training sample New sample: Novelty New sample: In-distribution

- Novelty detection is a branch of self-supervised learning that prédicts whether a sample belongs to a distribution given draws from distribution
- Idea: If simulation drifts out-of-sample, disable ML correction

## **One-Class Support Vector machine (OCSVM)**

- Idea: Directly estimate support of distribution by identifying compact region that contains all samples
- Maximize distance between dataset  $\{x_1, ..., x_n\} \in \mathbb{R}^d$  and the origin under feature mapping  $\Phi: \mathbb{R}^d \to F$
- Radial basis function (RBF) kernel
- Alternatives: covariance estimation, local outlier factor, other kernels

 $\min_{\substack{w \in F, \boldsymbol{\xi} \in \mathbb{R}^{n}, \rho \in \mathbb{R} \\ \text{subject to}}} \frac{\frac{1}{2} ||w||^{2} + \frac{1}{\nu n} \sum_{i} \xi_{i} - \rho}{(w \cdot \Phi(\mathbf{x}_{i})) \ge \rho - \xi_{i}, \ \xi_{i} \ge 0.}$

• OCSVM novelty detection improves temperature and precipitation for predictions over baseline and ML-corrected simulations

	Run	T (K)	$SP \ (mm/day)$	PWAT $(kg/m^2)$
1	Baseline (1)	2.09	1.78	2.79
<b>2</b>	ML-corrected (2) with $g_{\rm Tq}$	1.86	1.43	3.31
3	ML-corrected with $g_{Tquv}$	2.43	3.39	5.33
4	ND ML (3) with $g_{Tq}$ , $\eta_{T,OCSVM}$	1.97	1.49	3.65
<b>5</b>	ND ML with $g_{\text{Tquv}}, \eta_{\text{T,minmax}}$	5.15	3.57	10.14
6	ND ML with $g_{\text{Tquv}}, \eta_{\text{T,OCSVM}}$	1.58	1.40	2.66
7	ND ML with $g_{\text{Tquv}}, \eta_{\text{Tq,OCSVM}}$	1.53	1.24	2.37

#### Conclusion

- Developed a pipeline for incorporating novelty detection into an ML-corrected climate model.
- Novelty detection improves temperature & humidity prediction of coarse-grid ML-corrected climate models.
- Future work: build on this proof-of-concept and experiment with other novelty detectors, parameters, and ML correction approaches.
- A version of this appeared at the NeurIPS 2022 "Tackling Climate Change with ML" workshop and is on arXiv. Check it out →
- Submission planned to JAMES journal, with some experimental changes due to upstream bug fix.
